

Fork Positioner for Forklift

Forklift Fork Positioner - The fork positioner is a hydraulic device which could allow the person driving to be able to work the lift truck without leaving the seat. They are constructed out of high quality materials and are designed to be able to endure the most demanding procedures and work surroundings. Side shifting models have the added ability to be able to laterally position the arms or the entire load so as to facilitate much more exact carrying and placement in a quicker and more efficient manner.

The unique fork pocket design can enable operators to be able to safely swing the unit's blades without any fear of damaging the positioning cylinders. This could allow the operator the choice to either execute simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
